\*Random-effects model unless otherwise specified.

\*\*Fixed-effects model.

Quick diagnostic tests are available commercially for this and it only takes ~ 20 minutes to determine the result and the test does not require specialized laboratory techniques or equipment. 110 (22): p. The greatest number of cases of Dengue ever reported globally was in 2019. 9 (6): p. [22] à ç Romi, R., F. Virus could circulate in the blood during this period, and therefore it is possible to transmit the virus to new non-infected mosquitoes, which can in turn infect other people. However, they require specialized equipment and staff training to perform these tests. The virus can also be detected test for a protein produced by the virus, called NS1. Toma, cold acclimation and female overwintering *Aedes albopictus* in Rome. The vector ability of Rico-Hesse, *Aedes Aegypti* is determined by the infectious genotype of the Dengue virus. 5. The levels of IgG antibodies take more time to develop and remain in the body for years. Methodist serological methods, such as the essays of enzymatic immunosorbents (Eliisa), can confirm the presence of a recent or past infection, with the detection of anti-deonous antibodies. The need to adhere to other preventive measures for disease such as vector control well performed and supported is underway. Many cases are also erroneously diagnosed like other fever diseases [1]. A modeling estimate indicates 390 million dense virus infections per year (credible interval of 95% 284 "528 million), of which 96 million (67" 136 million) manifest clinically (with any gravity of the disease) [2]For countries that consider vaccination as part of their dense control program, pre-vaccination screening is the recommended strategy. Despite a risk of existing infection in 129 countries [3], 70% of the actual burden is in Asia [2]. The number of Dengue reported to those who increased by over 8 times in the last two decades, by 505,430 cases in 2000, in 2000, to over 2.4 million in 2010 and 5.2 million in 2019. The Americas, in the South-East South -East And the regions of the western Pacific are the most seriously affected, with Asia representing ~ 70% of the global burden of the disease. Only the number of cases increases when the disease spreads in new areas including Europe, but explosive outbreaks are being verified. The global incidence of Dengue Burden has grown dramatically all over the world in recent decades. 59: p. Plos has neglected tropical diseases, 2015. However, there is evidence of the possibility of maternal transmission (from a mother pregnant to her child). Á [4] à ç tjadén, n.b., et al., Period of extrinsic incubation of dense: knowledge, backlog and applications of temperature dependence. [6] Watts, D.M., et al., Effect of the temperature on the vector efficiency of *Aedes Aegypti* for the Dengue virus 2. The warning signs that doctors should look for: severe abdominal pain reliever vomiting that breathe gums or enlargement nose of the enlargement bruise of the vomiting or stools. If patients manifest these symptoms during the critical phase, a close observation for the next 248 hours "is essential, so that it is correct it is possible to provide medical treatment to avoid complications and risk of death. Even attentive monitoring should continue During the convalescent phase. Diagnostic methods can be used for the diagnosis of infection by Denv. Journal of Vector Ecology, 2006. The time taken from the ingestion of the virus to the actual transmission to a new guest is defined as the period of extrinsic incubation (EIP). Once contagious, the mosquito is able to transmit the virus for the rest of its life. 1584-1590 Dengue. The variations in the period of extrinsic incubation are not only influenced by the ambient temperature; numerous factors such as the fluctuations entity temperature [7, 8], the genotype of the virus [9] and the initial viral concentration [10] can also alter the time taken for a mosquito to transmit the virus. The disease is now now in over 100 countries in the regions of the WHO of Africa, the Americas, the eastern Mediterranean, the Southeast Asia and the western Pacific. This can vary from subclinical diseases (people may not know that they are even infected) to serious symptoms similar to influenza in infected ones. 7460-7465. The severe Dengue is a potentially fatal complication, due to plasma losses, accumulation of liquids, respiratory anguish, severe bleeding or organ compromise. Clinical infectious diseases, 2016. 292-304. The transmission from men to Mosquito can occur up to 2 days before someone shows the symptoms of the disease [5, 11], up to 2 days after the resolution of the fever [12]. Distribution and outbreaks before 1970, only 9 countries had experienced serious Dengue epidemics. 36 (1): p. E1760. IGM antibodies are detectable ~ 1 week after the infection and remain detectable for about 3 months. Depending on the clinical manifestations and other circumstances, patients can be sent at home, be directed for hospital management or require an emergency treatment and an urgent postponement [25]. Support treatments such as fever and painkillers reducers can be taken to control the symptoms of muscle pain and fever. American Journal of Tropical Medicine and Hygiene, 2006. Another study on the prevalence of the Dengue estimates that 3.9 billion people are at risk of dense virus infection. Those who have underlined the importance of supporting the efforts to prevent, detect and treat the diseases transmitted by vectors during this pandemic such as the dense and other arboviral diseases, the numbers of cases increase in different countries and place urban populations at greater risk for both diseases. 58 (6): p. Archives de Pédiatrie, 2014.1. ç Wagoner, J.J., et al., Viremia and clinical presentation in patients infected with Zika viruses, Chikungunya virus and Dengue virus. Dengue has an alarming impact both on human health and on global and national economies. Men's transmission can to Mosquito Mosquito infected with viremic people with Denv. 9072-9077. The serious Dengue has a higher risk of death when it is not managed appropriately. 48 (5): p. But it also represents the recognition of the government of the burden and therefore the relevance to denounce a burden of the Dengue disease. [20] à ç Scott, T.W., et al., Longitudinal studies of *Aedes Aegypti* (Diptera: Culicidae) in Thailand and Puerto Rico: Food frequency. [8] Laborchts, L., et al., Impact of daily temperature fluctuations on the transmission of the Dengue virus from *Aedes Aegypti*. Today, a serious dense affects most of the Asian and Latin American countries and has become one of the main causes of hospitalization and death between children and adults in these regions. The subclassification of the Dengue with or without warning signals is designed to help Triage professionals patients for hospitalization, ensuring close observation and to minimize the risk of developing the most serious dense [25]. Denvengeenengue should be suspected when a high fever (40 à ° C/104 à ° F) is accompanied by 2 of the following symptoms during the feverish phase (2-7 days): severe headache behind the eyes and joint pain of Delouseavomitingswollen Wollenshá ç The severe Denguea patient enters what is called the critical phase normally normally normally about 3-7 days after the onset of the disease. 6 (8): p. 98 (6): p. 149-151. 504 "507. The Dengue has distinct epidemiological patterns, associated with the four serotypes of the virus. 1926, Manila: Bureau of Science. 14688 - 14693. Acts of the National Academy of Sciences of the United States of America, 2011. The combined impact of the Epidemics Covid-19 and Dengue could have devastating consequences on risk populations. Transmission through the Mosquito Bi virus The infected female mosquitoes, mainly *Aedes aegypti* mosquito. The serious Dengue was recognized for the first time in the 1950s during the Dengue epidemics in the Philippines and Thailand. Thailand. of the National Academy of Sciences of the USA, 2015. The risks of the community for the Dengue also depend on the knowledge, attitude and practice of the population towards the Dengue, not the implementation of routine sustainable vector control activities in the Community. Consequently, the risks of the disease can change and change with climate change in tropical and subtropical areas and the carriers could adapt to new environment and climate. Prevention and control if you know you have a Dengue, avoid getting further mosquito bites during the first week of illness. In 2012, an outbreak of Dengue on the Islands of Madeira del Portugal led to over 2000 cases and the imported cases were detected in continental Portugal and 10 other countries in Europe. 7 (6): p. Severini and L. [21] is Medlock, J.M., et al., Analysis of the survival potential and seasonal activity of *Aedes Albopictus* (Diptera: Culicidae) in the United Kingdom. The Dengue continues to influence Brazil, India, Vietnam, the Philippines, the Cook Islands, Colombia, Fiji, Kenya, Paraguay, Peru and the Reunion Islands, in 2021. The Covid-19 pandemic is By making immense pressure on health care and world management systems all over the world. These anti-inflammatory drugs act thinning blood and in a disease at risk of bleeding, blood fluidants can exacerbate the prognosis. For a serious dense, medical treatments by doctors and nurses experienced with the effects and progression of the disease can save human lives "decreasing mortality rates less than 1% in most countries. 65 ( 2): p. Subsequent infections (secondary infection) by other serotypes increase the risk of developing a serious dense. Other species within the *Aedes* genre can also act as vectors, but theirs He is secondary to *Aedes Aegypti*. The EIP takes about 8-12 days when the ambient temperature is between 25-28 à ° C [4-6]. In November 2017, the results of an additional analysis to retaliate Serostatus retrospectively at the time of they have been released. The samples of patients collected during the first week of illness should be tested with both methods mentioned below: virus insulation methods the virus can be isolated from the blood during the first days of infection. While vertical transmission rates seem low, with the risk of vertical transmission apparently linked to the times of the denseation by Dengue during pregnancy [14-17]. Vaccination should be considered part of an integrated Dengue prevention and control strategy. The presence of IGM is indicative of a recent Denv infection. Bulletin of the World Health Organization, 1980. The indigenous cases are now observed on an annual basis in a few European countries. Symptoms usually last for 2 - 7 days, after a period of incubation of 4 - 10 days after the bite from an infected mosquito [25]. 37 (1): p. Wagoner, J.J., et al., Veromia and clinical presentation in Nicaraguan patients infected with Zika viruses, Chikungunya virus and Dengue virus. [14] à ç Basurko, C., et al., Estimation of the risk of vertical transmission of the Dengue: a perspective study. 107-118. Individuals, vaccinated or not, should look for rapid medical treatments if symptoms similar to Dengue occur. Risk factors infection increases the risk that the individual develops a serious dense. 1-147. [26] à ç Dengue Vaccines: WHO POSITION Paper-September 2018 2018 Record Weekly epidemiological; No 36, 2018, 93, 457à ç à èlöp à è œ476 886-892. Various polymerase chain reaction

methods are available (RT-PCR) and are considered the gold standard. [18] Poliot, S.H., et al., Maternal and pregnancy a systematic review is performed. Deny is often mentioned from one place to another by infected travelers. When sensitive vectors are present in these new areas, it is possible to establish the local transmission. 22 (1): p. 108 (18); p. 496 (7446); p. Healthcare of the World Health Organization, 1981. Dengue is a one Viral disease that has quickly spread in all regions of those in recent years. The proximity of the vector breeding sites of the mosquitoes to the human home is a significant risk factor for the Dengue. At the moment, the main method to control or prevent the transmission of the Dengue virus is to fight mosquito vectors. It could reproduce in natural containers such as holes for trees and bromelia, but nowadays it has been well adapted to urban habitats and breeds mainly in artificial containers including buckets, mud pots, discarded containers and used tires, water drains. Piovane etc. Dengue an insidious disease in densely populated urban centers. The deaths reported between the year 2000 and 2015 increased from 960 to 4032, hitting the most young people for the most. Despite this alarming number of cases, the deaths associated with the Dengue were less than the previous year. High number of cases have been reported in Bangladesh (101,000), Malaysia (131,000) Philippines (420,000), Vietnam (320,000) in Asia.in. 2020, Dengue has affected several countries, with reports of increases in the number of cases in Bangladesh, Brazil, Cook Islands, Ecuador, India, Indonesia, Maldives, Mauritania, Mayotte (FR), Nepal, Singapore, Sri Lanka, Sudan, Thailand, Timor Est and Yemen. Bulletin of the World Health Organization, 1973. However, the crossed immune to other serotypes after recovery is only partial and temporary. Journal of Medical Entomology, 2000. Although less common, some people develop a severe Dengue, which can be any number of complications associated with serious bleeding, organ compromise and/or plasma losses. [11] Dong, V., et al., Asymptomatic humans transmit the Dengue virus to mosquitoes. Its geographical diffusion is largely due to its tolerance under the colder conditions, egg and adult [21, 22]. E. AE. Aegypti, AE. Albopictus is also one day bir bir Aegypti is not either present or present with low number [23, 24] characteristics of the disease (signs and symptoms) while most cases of deliue is asymptomatic or shows mild symptoms, can manifest itself as a serious disease and similar to a influence that affects infants, children and adults, but rarely causes death. The World Health Organization classifies the Dengue in 2 main categories: Dengue (with / without warning signals) and dense serious. [19] Trpis, M., et al., Diel periodicita in the landing of Aedes-aegyptis on man. [25] World Health, O., Dengue: guidelines for diagnosis, treatment, prevention and control. E2190. However, the data are not yet complete and the Covid-19 pandemic may also have hindered reports of reporting in different countries. The alarming general increase in the numbers of cases in the last two decades is partly explained by a change in national practices to record and denounce the Dengue to the Ministries of Health and WHO. 937-943. Decisions on the implementation of a pre-vaccination screening strategy require careful evaluation at the country level, including the consideration of sensitivity and specific test specifications and local priorities, of the epidemiology of Dengue, of hospitalization rates in the hospital of the specific Dengues of the country and convenience of both CYD-TDVs and screening tests. 623-630. Most people are viremic for about 4-5 days, but viremia can last up to 12 days [13]. Materna transmission The primary mode of transmission of Denv among humans involves mosquito vectors. [16] Sinhabahu, V.P., R. 143-152. Depending on the patient's presentation time, the application of different diagnostic methods can be more or less appropriate. Plos has neglected tropical diseases, 2013. The total number of cases apparently is During the years 2020 and 2021, not for the reported deaths. ObsEDing & Gynecological Survey, 2010. Diseases transmitted by carriers and zoono, 2010. 75 (5): p. All regions were interested and the transmission of the Dengue was was in Afghanistan for the first time. The American region alone reported 3.1 million cases, with over 25,000 classified as serious. The recovery from the infection is believed to provide permanent immunity from that serotype. With this strategy, only people with tests of a past dense infection would be vaccinated (based on an antibody test or on a documented laboratory by delige infection confirmed in the past). [24] Metselaar, D., et al., A fool of type 2 dense fever in the Seychelles, probably transmitted by Aedes-Albopictus (Skuse). [23] Paupy, C., et al., Comparative role of Aedes Albopictus and Aedes Aegypti in the emergence of Dengue and Chikungunya in central Africa. 112 (47): p. 1584-1590. 63 (12): p. When a mother has a Denv infection when she is pregnant, children can suffer from pre-term birth, low weight at birth and fetal discomfort [18]. Other transmission transmission models were recorded via blood products, organ donation and transfusion. 29-32. The integration of vector management approaches is encouraged by who to reach sustainable and effective vector control interventions, effective and effective, to the countries for the effective management of dense outbreaks; support countries to improve their reporting systems and capture the true burden of the disease; provides training on clinical management, diagnosis and control of vectors at the country and regional level with some of its collaborative centers; formula strategies and policies based on evidence; support countries in the development of dense prevention and control strategies and adopting the global vector control response (2017-2030) examines the development of new tools, including products for insecticides and application technologies; Gathers; Registers of Dengue and serious Dengue of over 100 Member States; and publishes the guidelines and manuals for surveillance, cases management, diagnosis, prevention and control of the dengue for Member States. References asks a wagoner, J.J., et al., Veroma and Clinical presentation in infected Nicaraguans patients W11. During 24-48 hours of critical phase, a small part of the patients can manifest a sudden deterioration of symptoms. 7 (4): p. [5] Siler, J.F., M.W. Hall and A.P. Hitchens. Dengue: its history, epidemiology, transmission mechanism, etiology, clinical manifestations, immunities and prevention. These measures must be observed during the day both inside and outside the house (for example: at work/school) because the primary mosquito vectors biting during the day; It is recommended to wear clothes that minimize exposure to mosquitoes; involvement of the community: educating the community on the risks of the diseases transmitted by the mosquitoes; engage with the community to improve participation and mobilization for prolonged vector control; Active mosquitoes and virus surveillance: active monitoring and surveillance of abundance of vector and the composition of the species should be carried out to determine the effectiveness of the control interventions; prospectively monitor the prevalence of the virus in the population of mosquitoes, with the active screening of the sentinel mosquito collections; Vector surveillance can be combined with clinical and environmental surveillance. There are continuous research between many groups of international collaborators looking for new tools and innovative strategies that will contribute to global efforts to interrupt the transmission of the Dengue. 7 (795). American Journal of Tropical Medicine and Hygiene, 2018. 31 (2): p. These can co-circulate within one And in fact many countries are hyper-ensembles for all four serotypes. Journal of American Mosquito Control Association, 2006. 147 (1): p. C16 is obtained through: prevention of di Breeding; prevent mosquitoes from accessing egg laying habitats through environmental management and modification; Disposal of correctly solid waste and remove artificial artificial habitats that may contain water; coating, emptying and cleaning of housewater storage containers on a weekly basis; appropriate application insecticides to water storage external containers; Personal protection from mosquito bites: using personal families protection measures, such as window screens, repellents, coils and vaporizers. This can be someone who has a symptomatic dense infection, someone who has yet to have a symptomatic infection (they are pre-syntomatic), but also people who do not show signs of illness (they are asymptomatic) [11]. [10] Ye, Y.X.H., et al., Wolbachia reduces the aegypti aegypti transmission potential infected by the Dengue. Dengue: guidelines for diagnosis, treatment, prevention and control. [17] Basurko, C., et al., Maternal and fetal consequences of the denty fever during pregnancy. The presence of IgG is indicative of a past infection. Tettermo is not a specific treatment for the dense fever. Patients should rest, remain hydrated and ask for medical advice. American Journal of Tropical Medicine and Hygiene, 1987. [9] Anderson, J.R. and R. 623-629. The vaccination against the Dengue the First Dengue vaccine, Dengvaxia (CYD-TDV) developed by Sanofi Pasteur was authorized in December 2015 and has now been approved by the regulatory authorities in 20 countries. [15] Mazarin, N., J.M. Rosenthal and J. The threat of a possible outbreak of Dengue now exists in Europe; The local transmission was reported for the first time in France and Croatia in 2010 and the imported cases were detected in 3 other European countries. [13] Gubler, D.J., et al., In patients with dense infection naturally acquired. AE. Aegypti is a daytime power supply. His pungent periods are early in the morning and in the evening before sunset [19] he is female AE. AE. Often they feed more times between each period of deposition of eggs that leads to groups of infected individuals [20]. In the same way, the transovarial transmission of the virus inside the mosquitoes was also recorded. Vector ecology La Mosquito Aedes Aegypti is considered the main carrier of Denv. 89-101. PNA 2013). Do favors the reproduction sites close to dense vegetation, including plantations related to an increased risk of exposure for rural workers such as those in rubber and palm oil plantations, but is also found abundantly in urban areas. BMC Research Notes, 2014. Once a female has laid her eggs, these eggs can remain practicable for several months in dry conditions and will open when they are in contact with water. of 32 States in the United States and more in 25 countries in the European region, largely due to the international trade in used tires (a reproduction habitat) and other goods (for example a lucky child). The vast majority of cases are asymptomatic or mild and self-managed, and therefore the actual number of cases of Dengue is underestimated. [7] Carrington, L.B., et al., Fluctuals at low average temperatures accelerate the transmission of the Aedes Aegypti Dengue virus. After having fed a person with Denv infection, the virus replicates in the interval of mosquitoes, before it spreads to secondary tissues, including the salivary glands. Proceedings of the National Academy of Sciences of the United States of America, 2013. E0003894. Plos neglected Tropical Diseases, 2012. 10 (3): p. The analysis showed that the subset of the participants in the experimentation that were deduced Sovereign at the time of the first vaccination had a higher risk of dense dense and hospitalized from the dense compared to the unvaccinated participants. The best options to treat Symptoms are paracetamol or paracetamol. paracetamol. be avoided. [3] Brady, O.J., et al., Refining the global spatial limits of the transmission of the Dengue virus by means of consent based on evidence. The Dengue is caused by a virus of the Flaviviridae family and there are four distinct but closely related serotypes of the virus that cause Dengue (Denv-1, Denv-2, Denv-3 and Denv-4). 259-266. Sathananthan and G.N. Malavige, perinatal transmission of Dengue: a clinical case. Urbanization (especially not planned), is associated with the transmission of Dengue through multiple social and environmental factors: population density, human mobility, access to reliable water source, water storage practice etc. It is at this moment, when the fever goes down (less than 38 ° C/100 ° F) the patient can occur warning signals associated with a serious dense. Devenge, transmission of Mother Mother Dengue during the 2009-2010 Dengue epidemic: observation of four cases. 2009, Geneva: World Health Organization. AE. Albopictus is highly adaptive. Natura, 2013. The Dengue virus is transmitted by the female mosquitoes mainly of the Aedes Aegypti species and, to a lesser extent, AE. albopictus. The risk of mosquito infection is positively associated with high viremia and high fever in the patient; On the contrary, high levels of specific antibodies of DENV are associated with a reduced risk of mosquito infection (Nguyen et al. Plos neglected tropical diseases, 2013. The Dengue is spread in all tropics, with local variations in the risk influenced by Climate parameters as well as social and environmental factors. Degue causes a large spectrum of diseases. As such, the use of the Cyd-Tdv vaccine is targeted for people who live in endemic areas, 9-45 years old, who have had at least 1 episode of dense virus infection. Several candidates for very high vaccine against the vaccine against the they are in evaluation. Who is the position on the CYD-TDV vaccine [26] as described in the WHO position on the vaccine against Dengvaxia (September 2018) [26] live attenuated The CYD-TDV vaccine has been shown that in clinical studies it is effective and safe in people who have had a previous Dengue virus infection (HIV-positive individuals). European Journal of Obstrys & Gynecology and Reproductive Biology, 2009. These mosquitoes are also vectors of Chikungunya, yellow fever and Zika viruses. 1826-1832. [12] Nguyen, N.M., et al., The guest and viral characteristics of the cases of human dense modellar the population of infected and infectious mosquitoes of Aedes Aegypti. Mosquitoes.
