**Organometallic Compounds**  
An organometallic compound is generally defined as one that contains a metal-carbon bond. The metal element may be an alkali metal, an alkaline earth metal, or a transition metal. The organo group may be the metal atom or a carbon atom as a substituent. Some organometallic compounds are also organo-inorganic compounds, such as metal-organic frameworks and metal-organic polymers. The organo group may be a hydrocarbon, an alcohol, an amine, or a thiol.

**THE INFLUENCE OF INORGANIC AND ORGANIC POLLUTANTS  
ON THE RATE OF REPRODUCTION  
OF A MARINE HYPOTRICHOUS CILIATE :  
EUPLOTES VANNUS MULLER**

by G. PERSOONE and G. UYTTERSROT \*

**I - INTRODUCTION :**

"Although the concentrations of pesticides and heavy metals in potential seafood is currently attracting widespread attention, the effects of pollution on lower trophic levels in the sea remain almost unknown. In the sediment ecosystem pollution could have far-reaching consequences at high trophic levels through for example alteration of the composition of important species at low trophic levels in food webs, or by irradiation of organisms fundamental to the breakdown processes of the carbon, nitrogen and sulphur cycles."

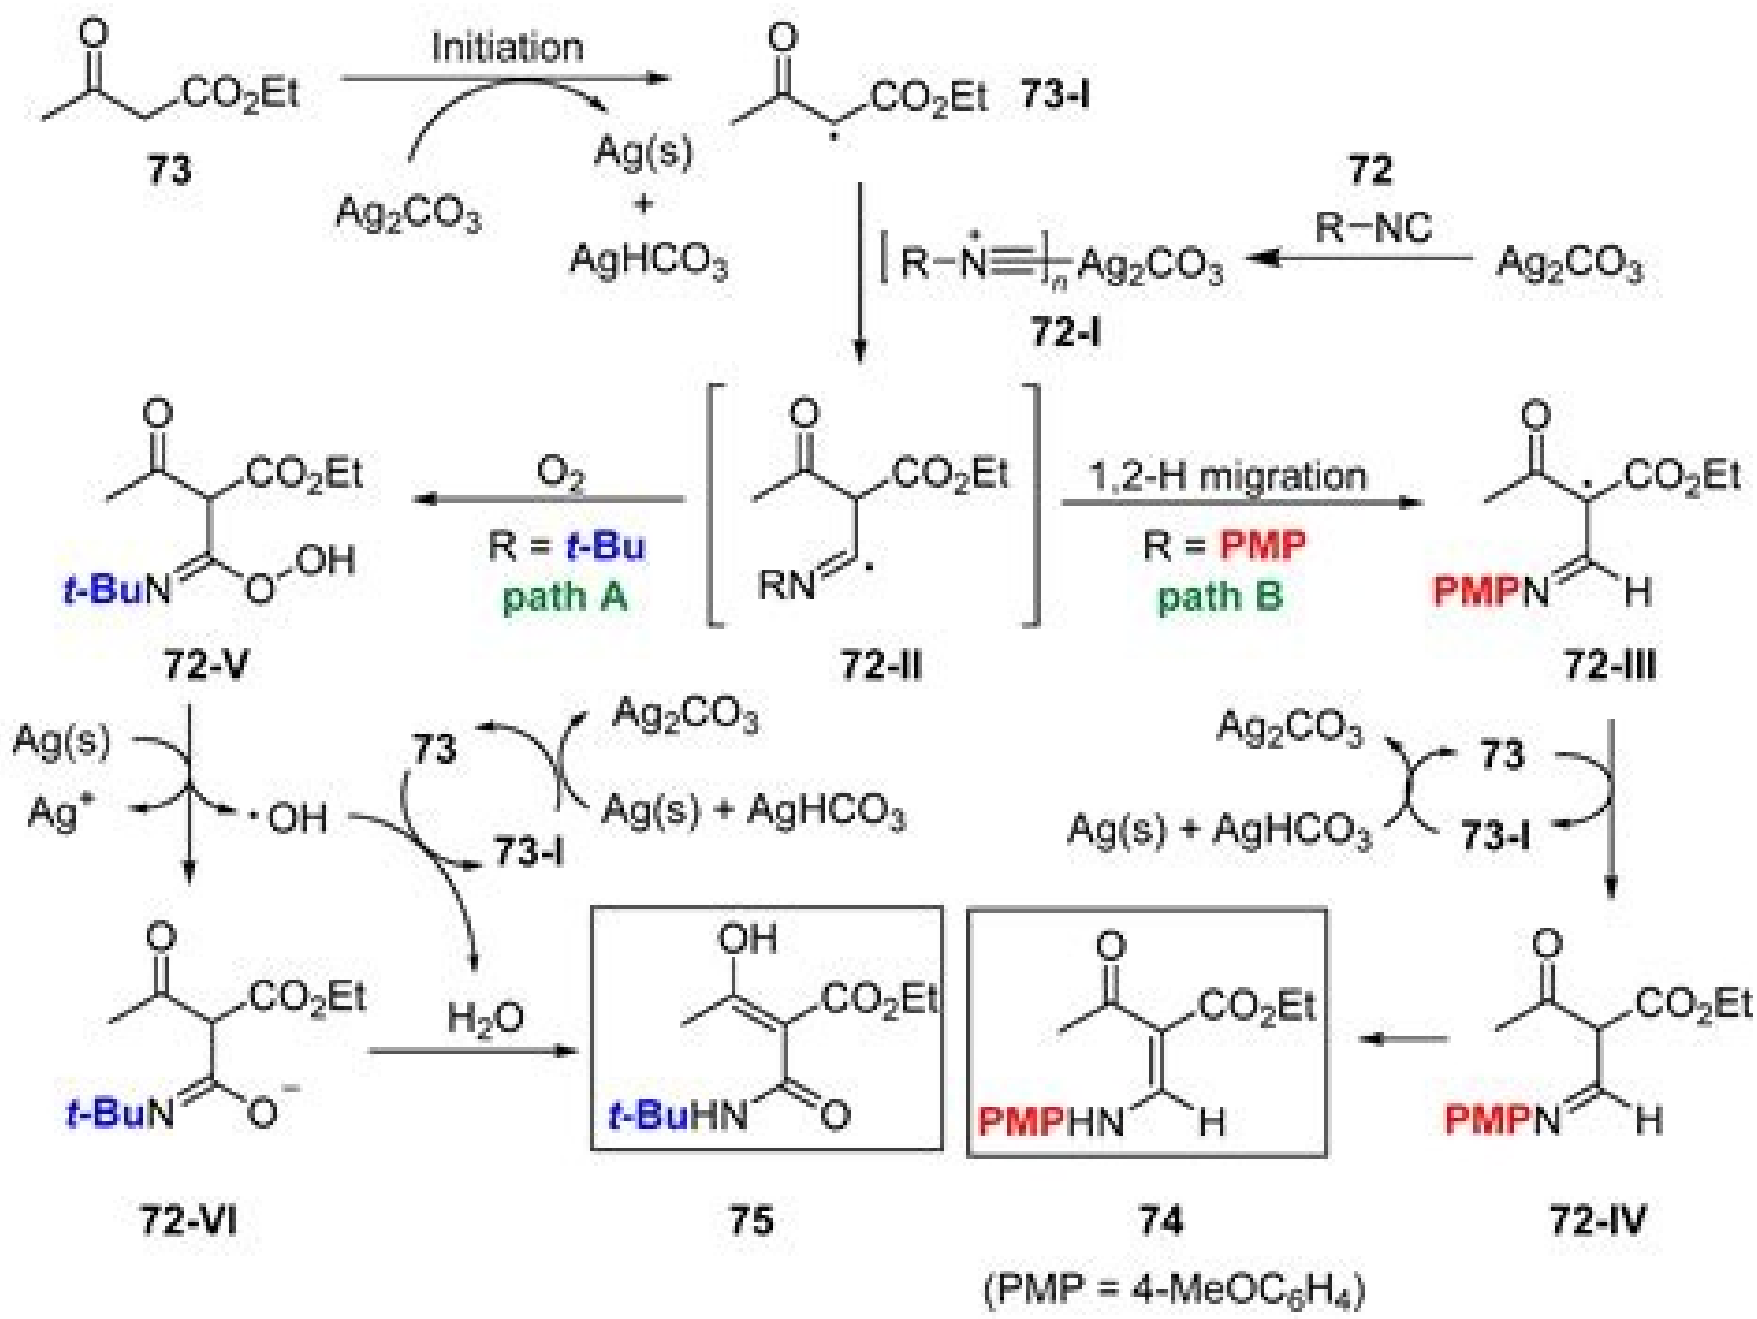

(Gray and Ventilla, 1971)

Although some literature concerning the sensitivity of benthic marine invertebrates (especially macrofauna) with respect to inorganic and organic pollutants becomes slowly available, we only could find a few publications dealing with bioassays on marine ciliates.

Fenchel (1967), however, stated :

"The biomass of marine ciliates in some types of sediments is of the same order or sometimes larger than the biomass of the micrometazoans (nematodes, turbellarians, gastrotrichs, etc...)" and Cooley and Keltner (1969) even stated that : "The abundance of ciliates in aquatic ecosystems and their importance as
